

1. Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.

Answer :

Step 1: Install FileZilla Server.

Step 2: Create a folder in the C: drive named FTPServer and use it as the shared FTP folder.

Step 3 : Connect with FileZilla Server.

Step 4: Open FileZilla Server → Configure → Users → Click Add User → Enter username Student → Click OK.

Step 5 : Set a password for the user account and enable Require a password to log in.

Step 6: Assign Shared Folder Permissions

- **Select the user.**
- **Under Mount Points, add C:\FTPServer.**
- **Enable:**
 - **Read ,Write , Delete ,Append**
- **Click Apply.**

2. Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.

Answer :

Step 1: Install and Open FileZilla Client.

Step 2: Connect to the FTP Server

Enter the FTP server credentials in the Quickconnect bar:

Field	Value
Host	127.0.0.1 (or Server IP Address)
Username	Student
Password	
Port	21

3. Click Quickconnect.

3. Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.

Answer :

Step 1: Create a folder in the C: drive named FTPDownload.

Step 2: Open FileZilla Client.

Step 3: Connect to the FTP Server

Enter the FTP server credentials in the Quickconnect bar:

Field	Value
Host	127.0.0.1 (or Server IP Address)
Username	Student
Password	
Port	21

3. Click Quickconnect.

Step 4 : Right side (Remote Site) open /My Pictures → Right click → click Download → check FTPDownload file.

Step 5 (Verification):

Right click original file → Properties → note file size.

Right click downloaded file → Properties → note file size.

Check that both file sizes are the same.

4. Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites). Hint: Think about how network admins monitor device health, bandwidth, or uptime.

Answer : SNMP (Simple Network Management Protocol) helps network administrators check whether network devices are working properly.

1. Internet Service Providers (ISPs)

Example: Jio, Airtel

Use:

- Check if routers and switches are working.
- Monitor internet traffic.
- Find network problems quickly.

Benefit:

Customers get a more stable internet connection.

2. College or Campus Wi-Fi

Use:

- Monitor Wi-Fi routers and access points.
- Check how many users are connected.
- Detect if any device goes offline.

Benefit:

Students and teachers get reliable Wi-Fi.

3. Large Websites and Companies

Example: Google, Amazon

Use:

- Monitor servers and network devices.
- Check network speed and uptime.
- Send alerts when a device stops working.

Benefit:

Websites stay online and run smoothly.

5. Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.

Feature	FTP	HTTP
Port Number	21	80
Security	Not secure by default	More secure when using HTTPS
Data Transfer Method	Transfers files between computers	Transfers web pages and website data
Use Cases	Uploading and downloading files	Browsing websites
Authentication	Usually requires username and password	May or may not require login
Connection Type	Uses separate connections for commands and data	Uses a single connection for requests and responses
